with a modified polylinker; Site 1: EcoR I; Site 2: Not I;
/ NCI CGAP Chi is a cDNA library containing the following
tissue(s): Chondrosarcoma Grade II. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oilgo-dr primes containing a
Not I site. Double stranded cDNA was ligated to an EcoR I
adaptor, digested with Not I, and cloned directionally
into pT713-Pac vector: The oligonucleocide used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
mannancach.

New mammalian DNA sequences encoding transmembrane, receptor on PRO polypeptides, useful for screening of potential peptide or molecule inhibitors of the relevant receptor/ligand interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAA37022 to AAA37144 encode the new isolated human transmembran receptor or secreted PRO polypeptides given in AAY99340 to AAY2 transmembrane and receptor PRO porteins can be used for screen potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sencoding then have various industrial applications, including pharmaceutical and diagnostic agents. AAA37145 to AAAA370 repprimers and hypridisation probes used in the isolation of the i
                                                                                                                                                                                                                                                                                                                      Wood
                                                                                                                                                                                                                                                                                                                    Watanabe CK,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to secreted and transmembrane pr
These proteins and the DNA encoding them may be used as hybrid
probes, in chromosome and gene mapping and in the generation o
sense RNA and DNA. They may also be used used to generate eith
transgenic animals or knockout animals which are in turn usefu
development and screening of therapeutically useful reagents.
                                                                                                Gurney AL,

The present sequence is one of seventeen nucleic acids encoding polypeptides. The PRO nucleic acids, polypeptides, agonists an antagonists are useful for treating cardiovascular, endothelia angiogenic disorders in a mammal. Examples of these disorders cardiac hypertrophy, trauma, cancer, age-related macular degenatherarcelerosis, hypertension, arterial restencisis, knymudal elementoid arthribis, angina, myocardial infarctions, thrombop and lymphangitis. The PRO polypeptides and antagonists are also prevert tumour angiogenesis and for treating periodontal disease also used to stimulate wound healing and tissue regeneratic nucleic acids, polypeptides and anti-PRO antibodies are useful diagnosing a cardiovascular, endothelial or anglogenic disorde: Seventeen nucleic acids encoding PRO polypeptides which are us diagnosis and treatment of cardiovascular, endothelial or angidisorders in a mammal.
